Implementation

Users create, edit, search, delete and autosave notes. The server translates the title and content with an OpenRouter LLM. Translations appear beside the original and can be copied or saved as a new note.

Notes persist in Supabase PostgreSQL through SQLAlchemy and Psycopg, with SSL and transaction-pooler-compatible connections. Vercel hosts the Flask app and frontend. CLI deployment synchronizes server environment variables. The production URL is accessible without Vercel login.

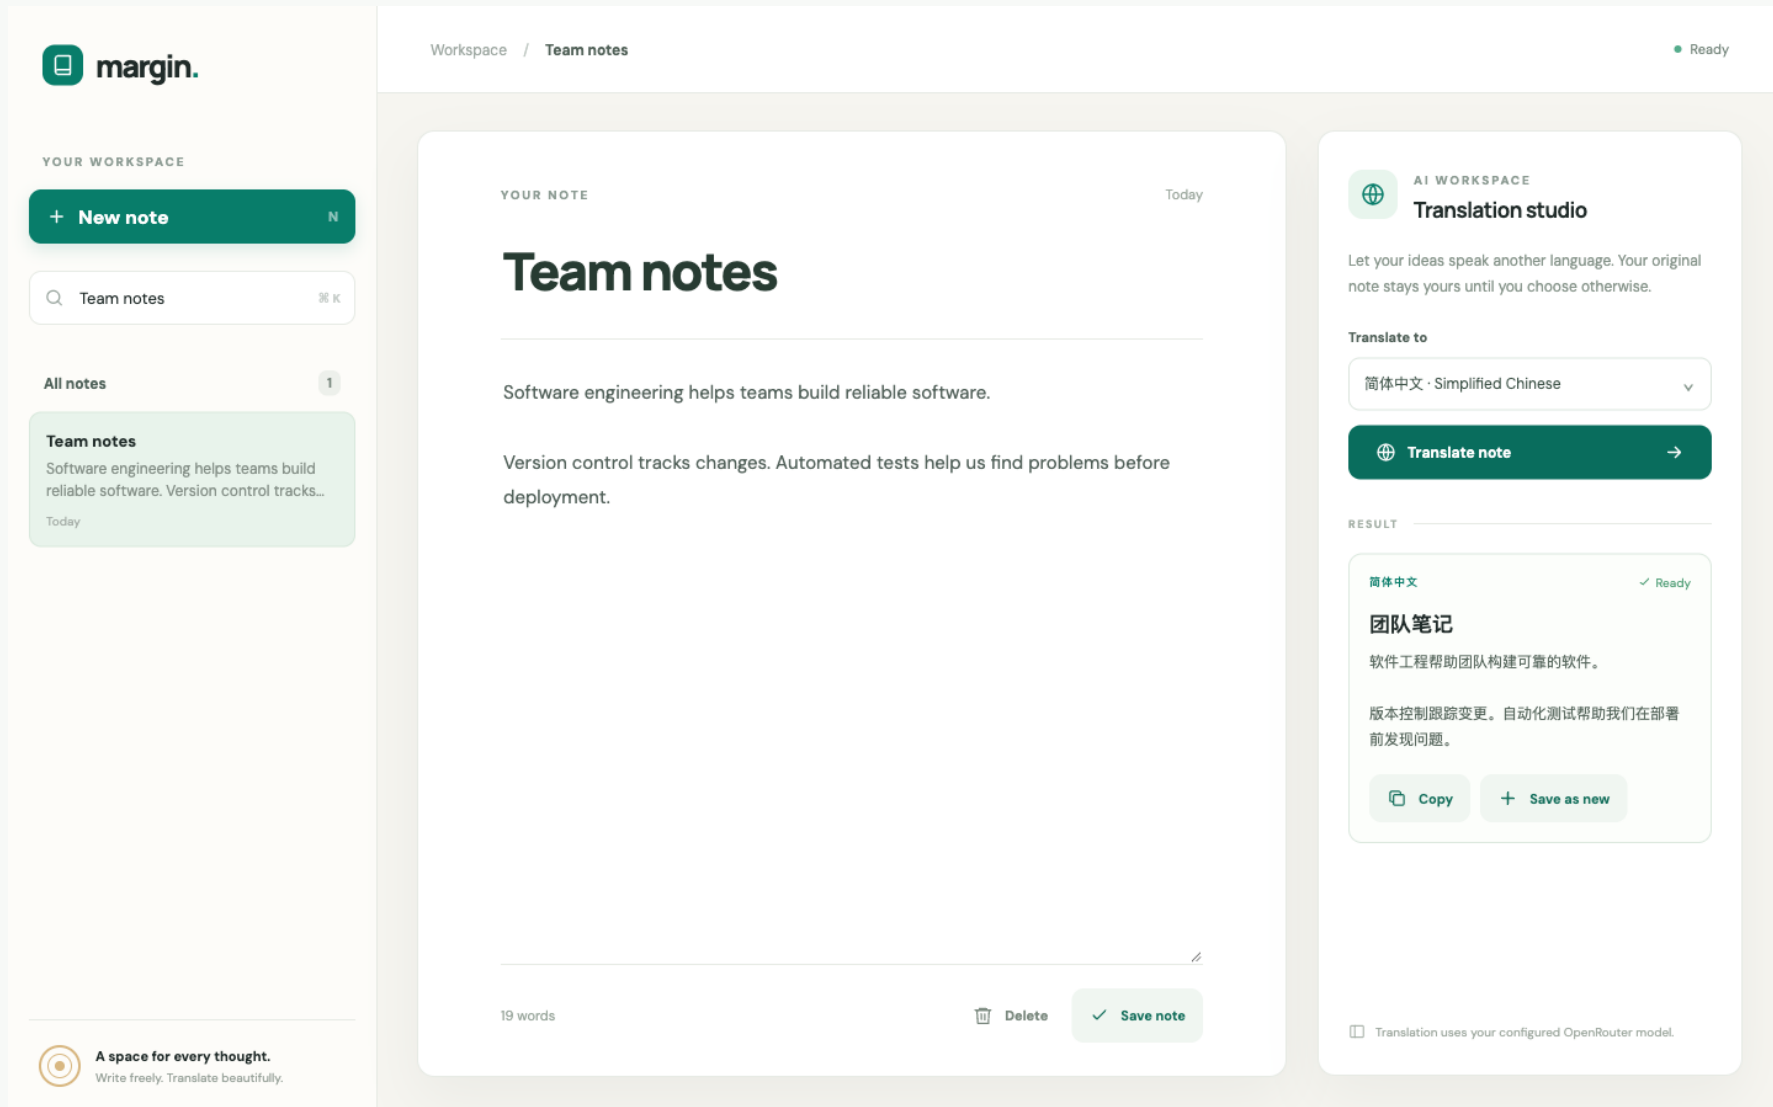

Verification - 05 October 2026

- 28 automated tests passed: note operations, validation, translation error paths and paragraph preservation.
- Production smoke test passed with the real database and model: CRUD, search, translation, save-as-new, original preservation and test-note cleanup.
- Browser verification showed a real Simplified Chinese translation and saved it as a separate note.
- Credentials are kept in ignored local files and server environment variables; browser assets and committed source contain no configured secrets.

Scope: Task 1 only. Task 2 evidence and the Canvas survey are separate coursework requirements.
